

# CRISMAT: activités “Mer et Littoral”

D. Chateigner  
CRISMAT (UMR CNRS 6508) - ENSICAEN  
IUT Caen, Université de Caen Normandie

## Matériaux biosourcés:

- CaCO<sub>3</sub>
- Lin (S. Eve)

Batteries – électrochimie (V. Pralong)

Thermoélectriques (F. Gascoin)

Caractérisation par rayonnements

- 8 diffractomètres rayons X
- 3 MET (CNRT)
- 2 MEB-EBSD (R. Retoux, S. Gascoin)
- Accès grands instruments

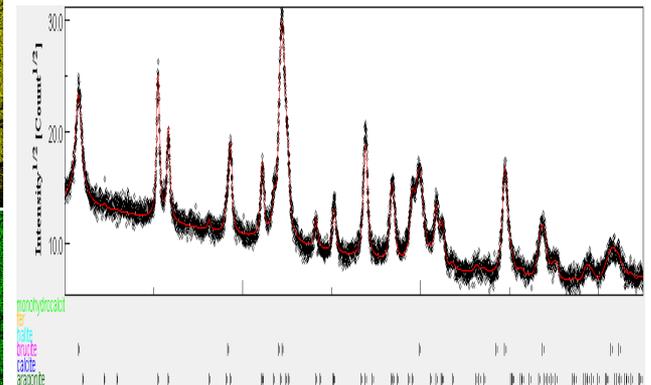

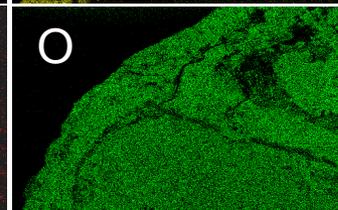

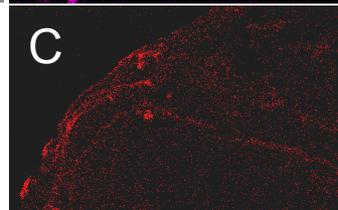

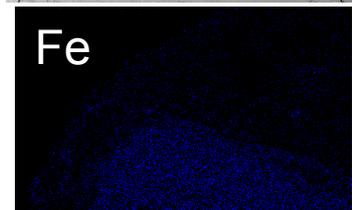

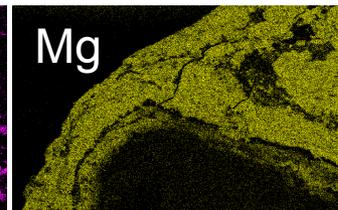

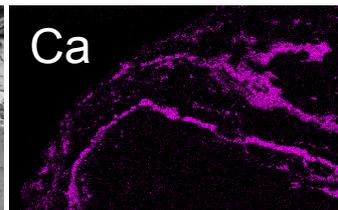

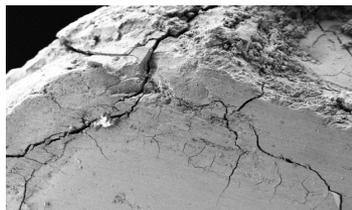

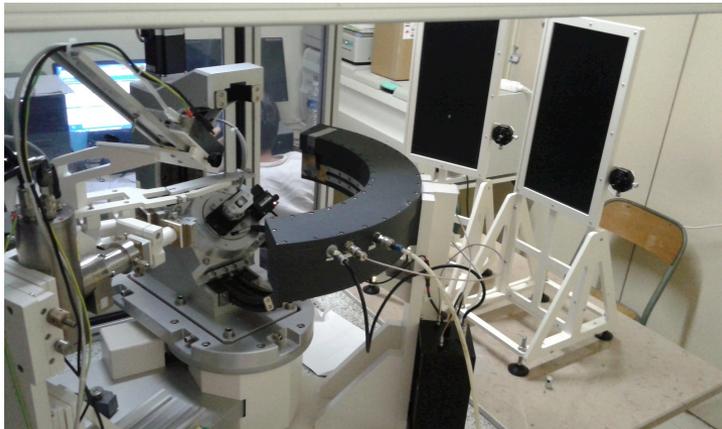

Caractérisations mécaniques (M. Gomina)

Préparations (fours, SPS, microondes, chimie douce, ...)

± 150 personnes  
(ED SIMEM)

Financed: 300k€ ANR + 80 k€ FEDER-CRBN  
CRISMAT-ABTE, La Rochelle, Nouméa

- ✓ **Renforts côtiers**
- ✓ **Renforts d'ouvrages marins**
- ✓ **Création de néo-habitats marins (Interreg Arc Atlantique Nord-Ouest)**
- ✓ **Captage de métaux**
- ✓ **Captage de CO<sub>2</sub>**
- ✓ **Recyclage direct de déchets coquilliers**
- ✓ **Recyclages direct de gravats, déchets bétonniers**

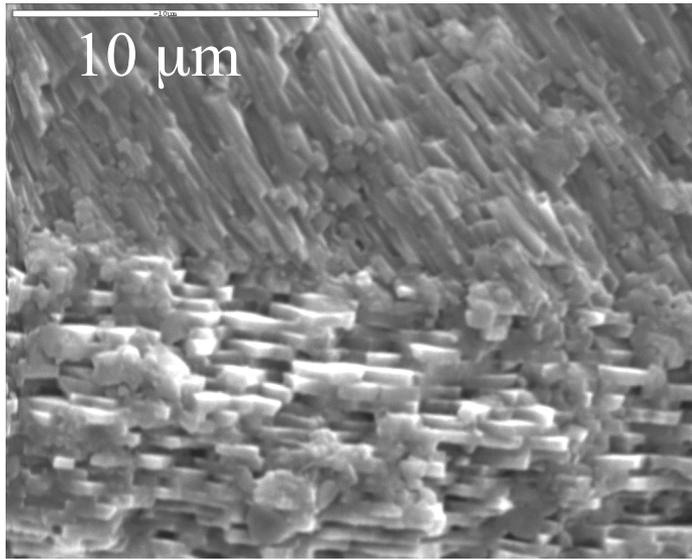

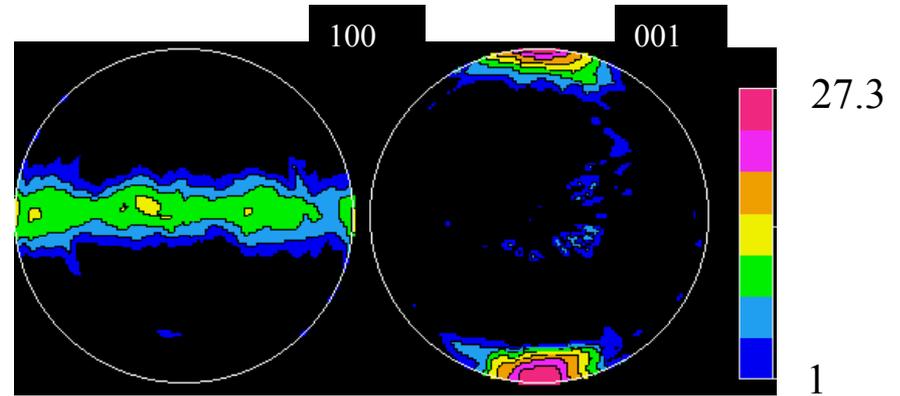

**Dang Dan N'Guyen, Otavio Gil (ABTE)**

## Microstructure versus texture

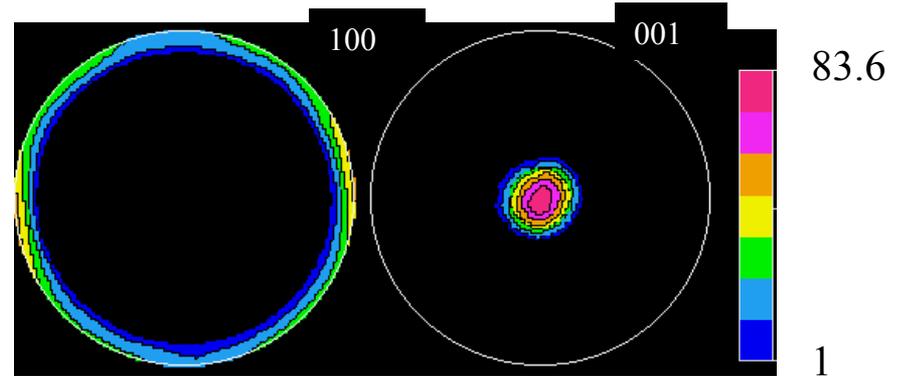

*Bathymodiolus thermophilus* (-2400m deep event mussel)

$$\langle \angle, 90 | \text{OFC} | I^{c,0} \rangle$$

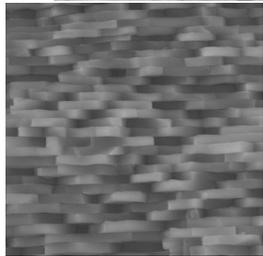

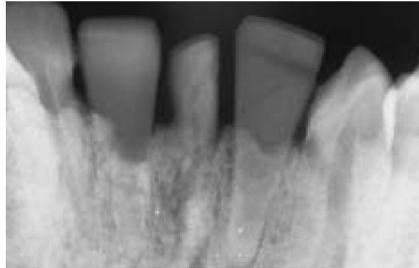

$$\langle \perp | \text{ISN} | *_{38}^{a,90} \rangle$$

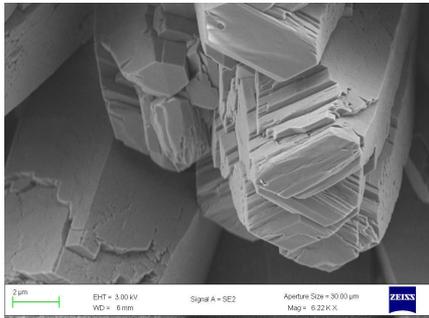

# Nacre and implants (started 1996)

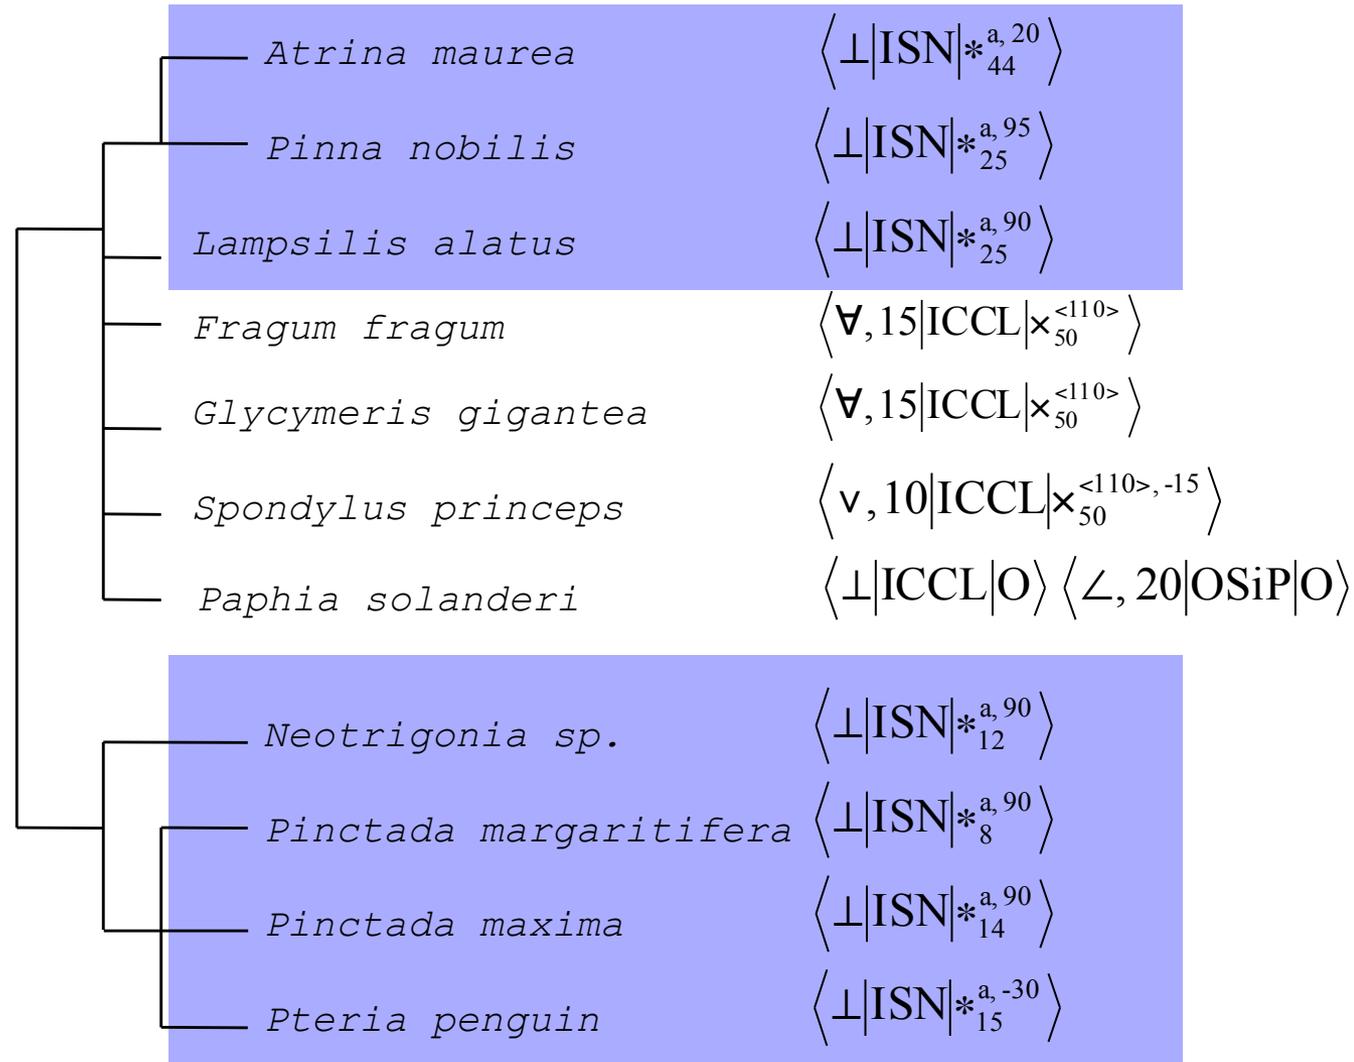

*Pinctada margaritifera*, *P. maxima* and *Pinna nobilis* nacres: Bio-compatible and **osteo-inductive** for human osteoblasts (E. Lopez (MNHN))

*P. Margaritifera* **Bivalvia**

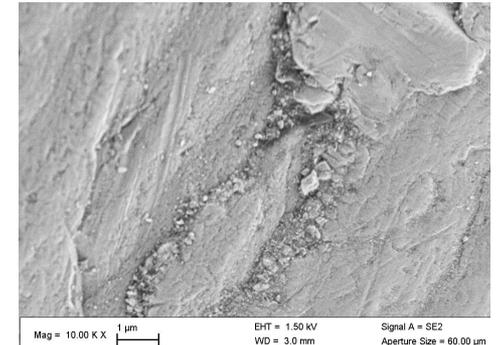

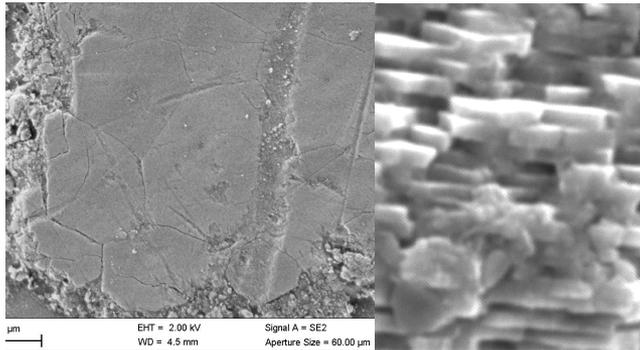

CaCO<sub>3</sub>/Ti (Otavio Gil)

Financed: 30k€ Région Centre  
CRISMAT, ISTO Orléans (X. Bourrat)

*Hyriopsis cumingi* (freshwater mussel), China

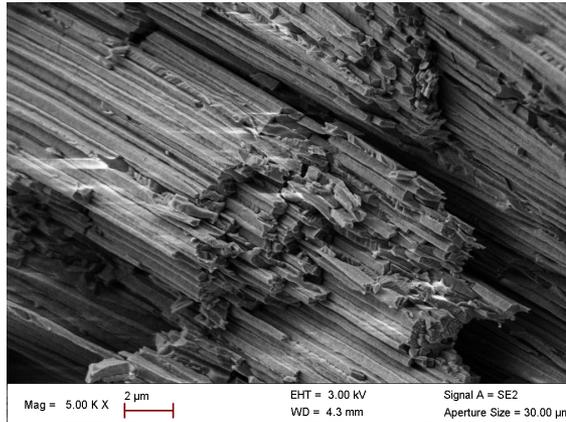

sheet nacre (aragonite)

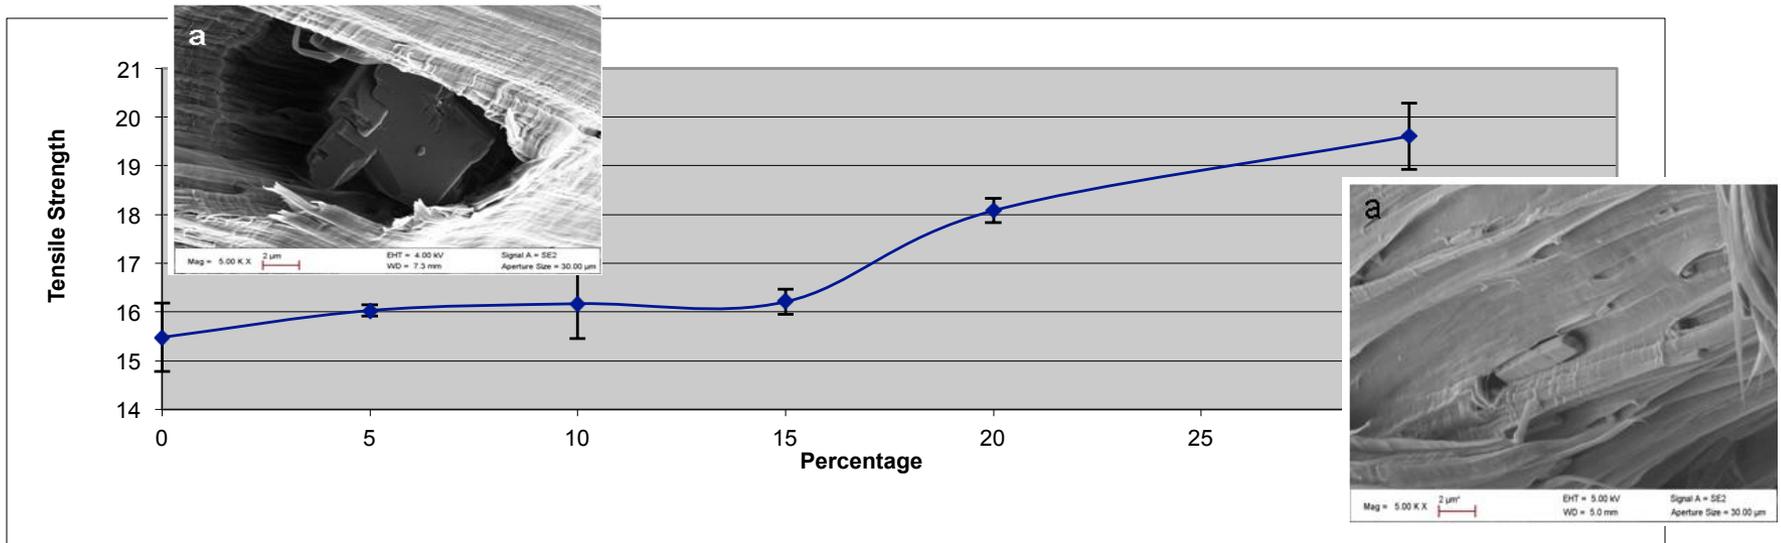

vaterite defect

# Polymer reinforcement (from 2014)

LCMT (Loïc Le Pluart) – CRISMAT (Sophie Eve)

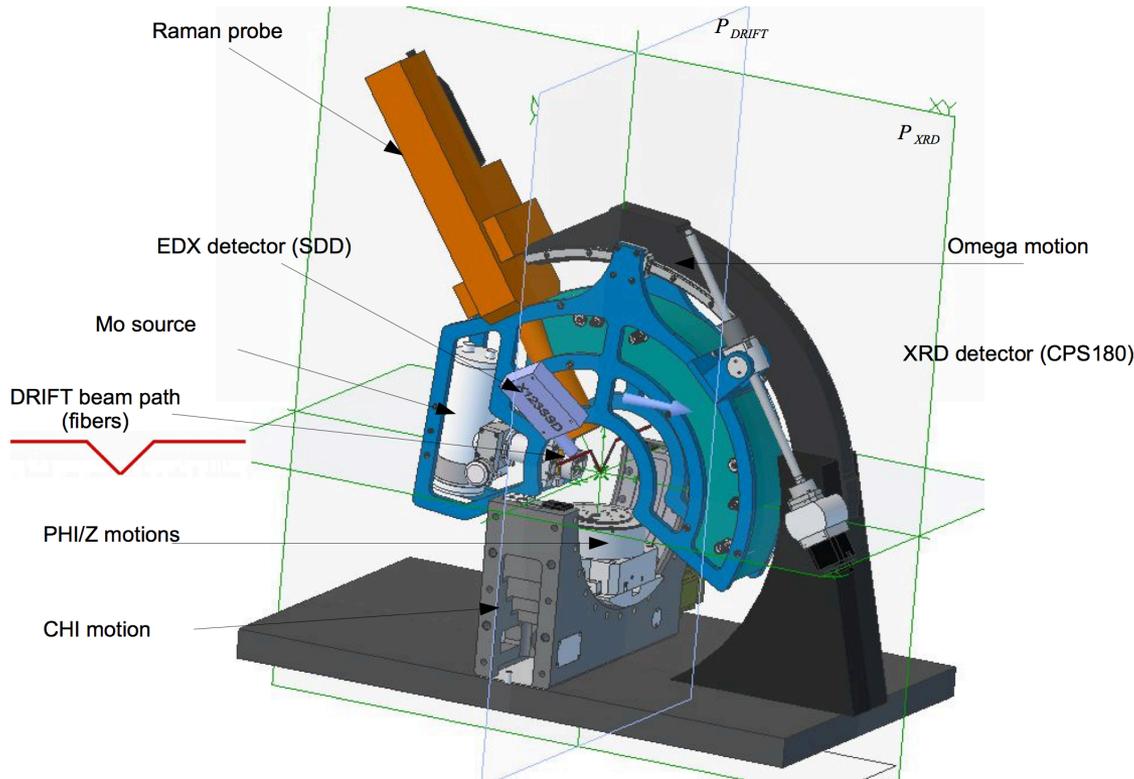

*Pecten maximus*  
*Crepidula fornicata*  
*Crassostrea gigas*

Financed: 10 M€ total, 1.3 M€ for CRISMAT

Acteurs: CRISMAT, ERAMET (SLN), SSD, BRGM, TU-Deft, Univ. Vilnius, Univ. Trento, Univ. Verona, Thermofisher

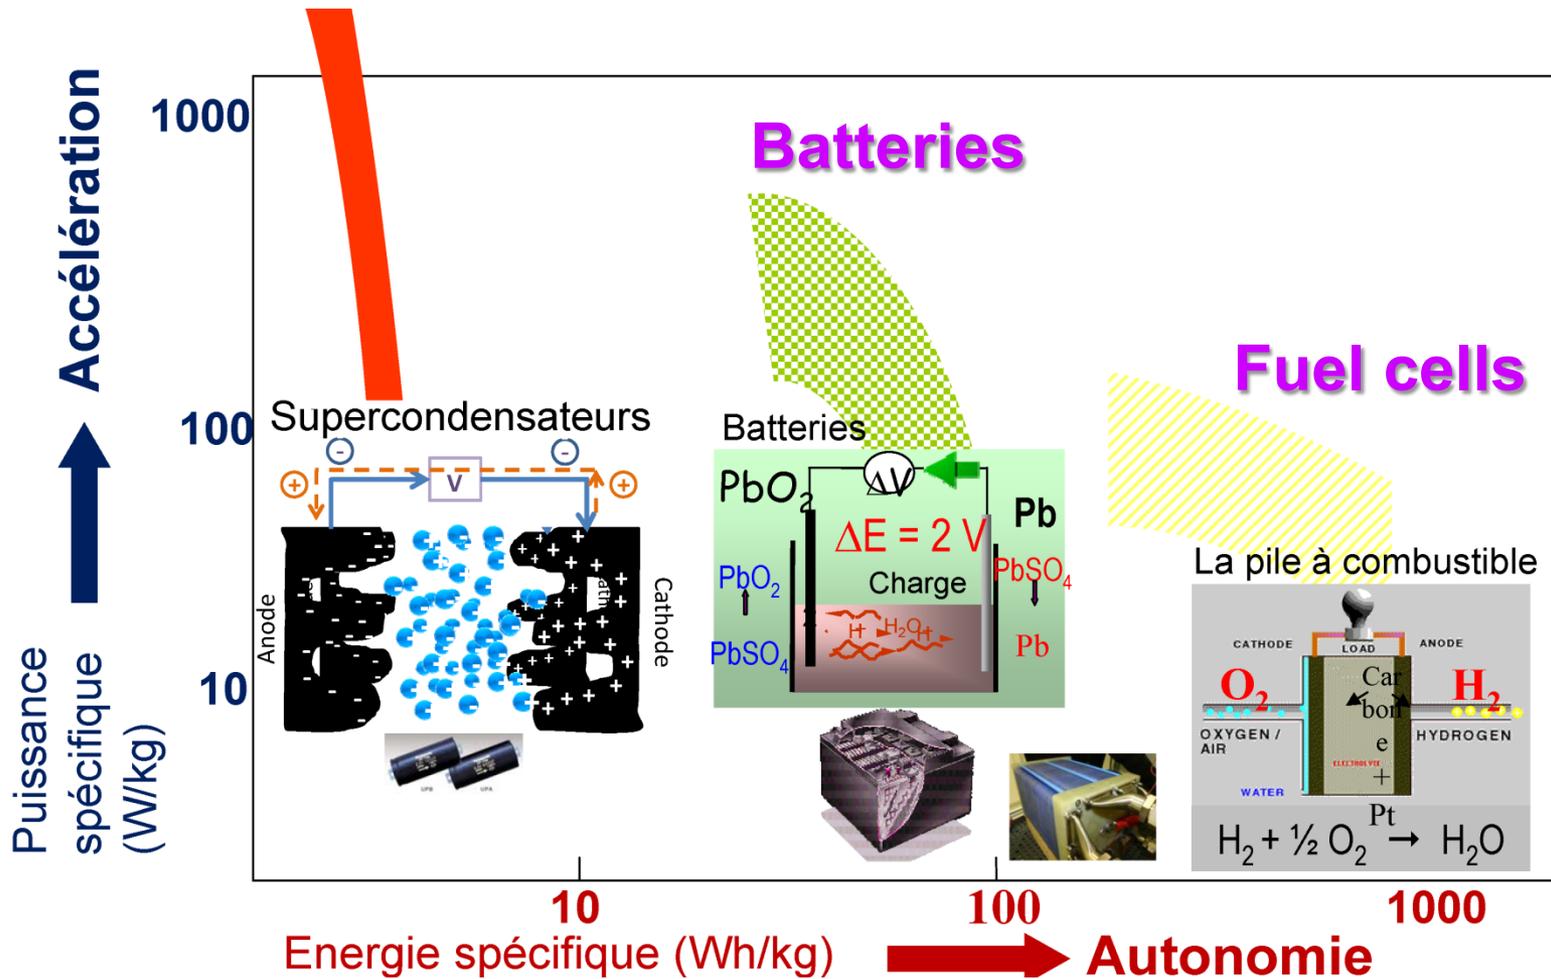

XRD-XRF-Raman-IR

On-line On-mine  
Measurement + analysis

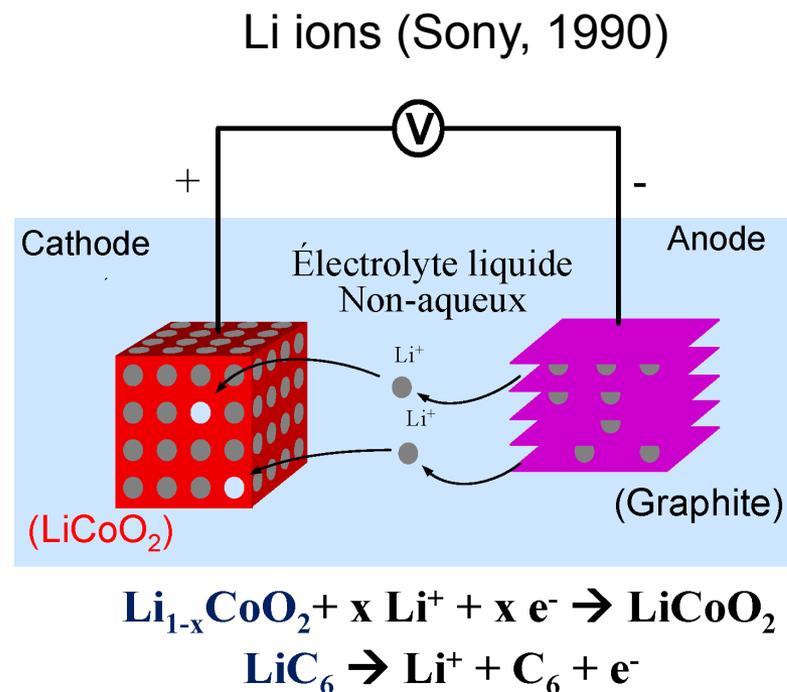

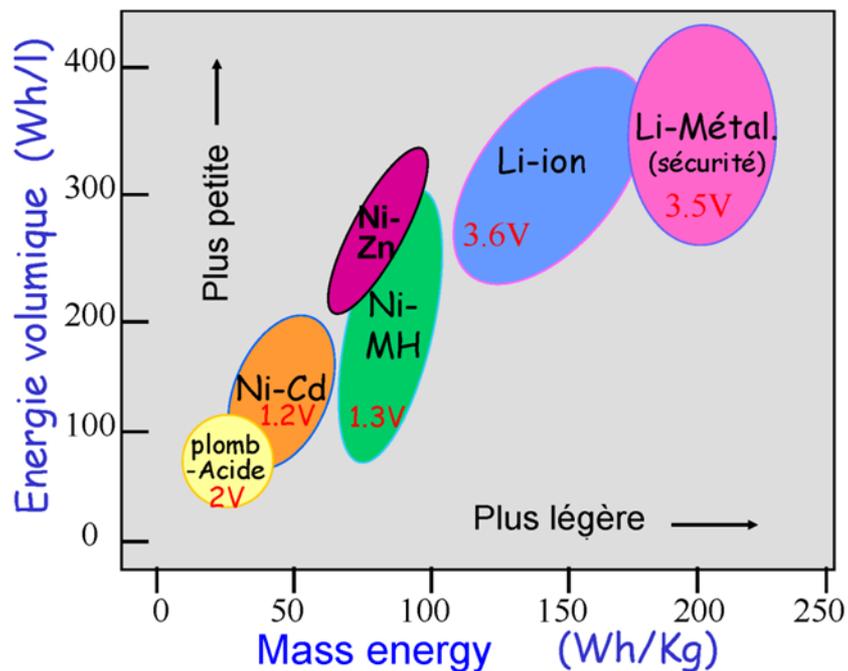

Société Le Nickel (Nouméa)

Heavy ions and metal traces

# Batteries

How to design materials in solid state chemistry ?  
 What are the main characteristics and challenges for materials in batteries and fuel cells ?

One of the best electrochemical advanced of the 20<sup>th</sup> century

**Capacité Spécifique** :  $\text{Ah/kg} = \frac{26,8 \times \Delta x}{M}$

Annotations:

- 26,8 : Nbr d' e<sup>-</sup> ou Li<sup>+</sup>
- M : Masse Molaire (kg)

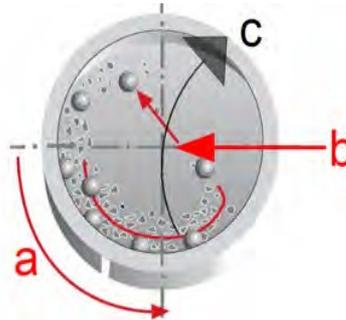

# ANR DAME: as-prepared $\text{Li}_4\text{Mn}_2\text{O}_5$ □

Mechanochemical synthesis \*

Grinding Bowl in tungsten carbide WC (+4 balls)

- Grinding time influences
  - Under Ar
  - 20 hours

→ « Nano » scale  
**Electrochemical Performances**

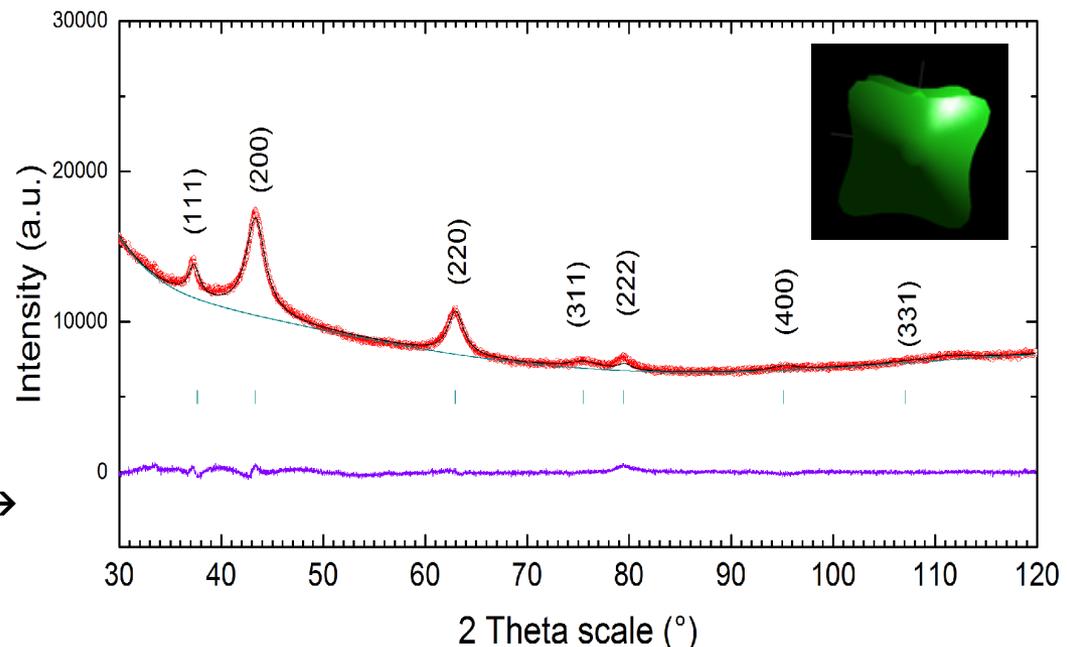

**Amorphization**

*A priori:*  
 $Fm-3m$  space group  
with the cell parameter  $a=4.17(2)\text{\AA}$   
 $\chi^2=1.53$

Disordered  
rock salt type structure  
16% oxygen vacancies

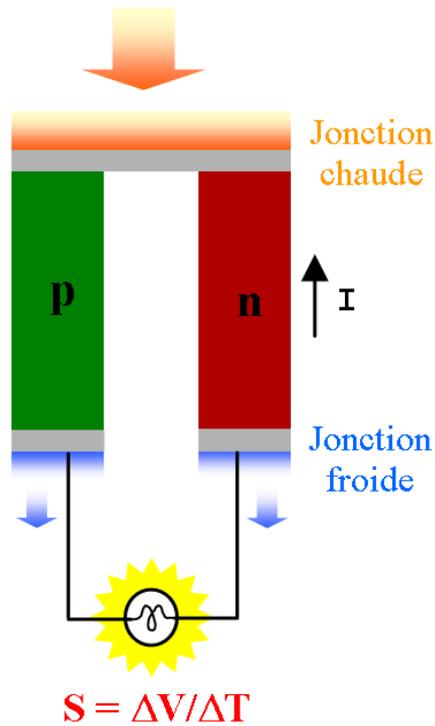

X Ray diffraction pattern →

# Thermoélectricité

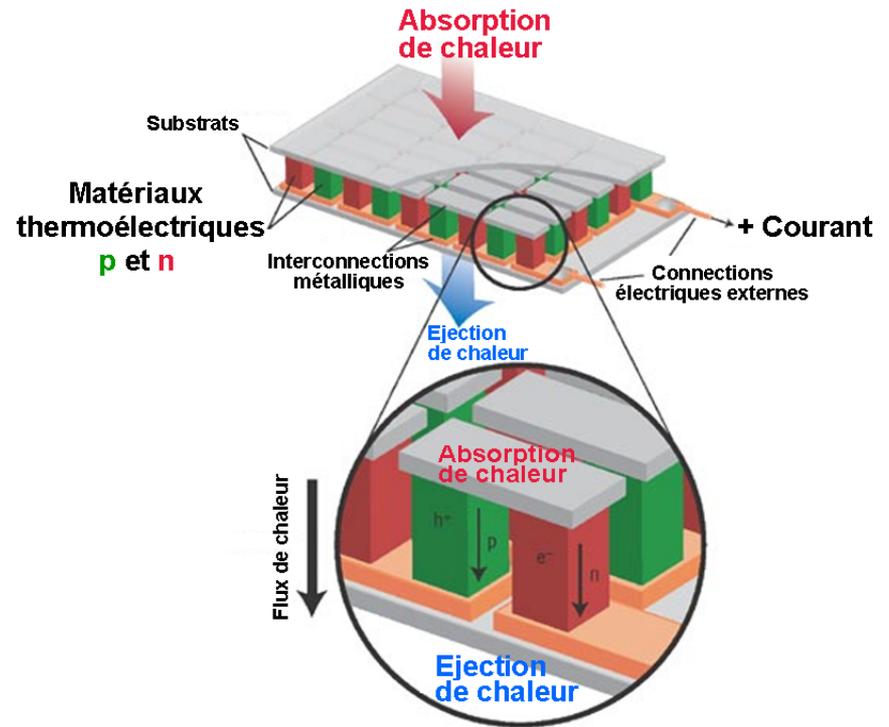

## Effet Seebeck

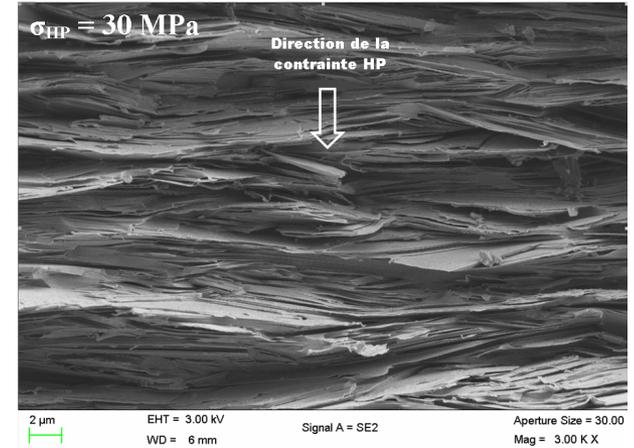

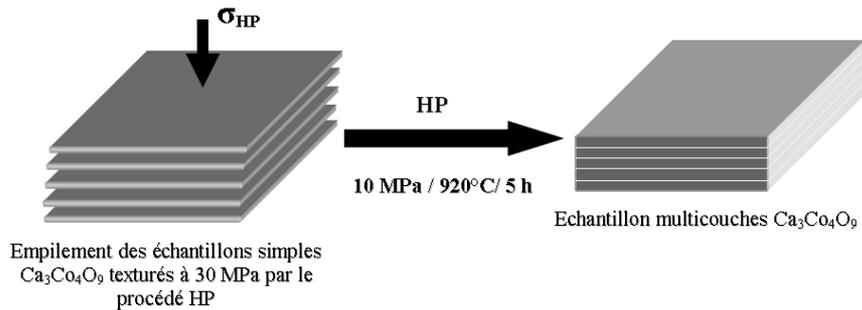

Génération d'électricité

## Générateur Peltier

Puissance électrique

## Matériaux épais multicouches (SPS)

- ✓ microstructure et alignement des plaquettes similaires à ceux d'une monocouche
- ✓ Soudage des monocouches entre elles (épaisseur d'interface  $\leq 50 \text{ nm}$ )

D. Kenfoui, J. Noudem
